### Disease Development

A small version of the disease triangle diagram from slide 43, showing the intersection of 'Susceptible host', 'Virulent pathogen', and 'Favorable environments' leading to 'Disease'.

- **Host range:** the range of plants on which a pathogen infects
  - *Ophiostoma ulmi*: the causal agent of Dutch elm disease
    - Host range: only elm trees (*Ulmus* spp.)
  - *Verticillium dahlia*: the casual agent of Verticillium wilt
    - Host range: over 300 woody and herbaceous including tomato, strawberry, rose, maple, and elm
- **Immune:** cannot be infected by a given pathogen

44

---

---

---

---

---

---

---

---

### Disease Development

A small version of the disease triangle diagram from slide 43.

- **Penetration:** the initial invasion of a host by a pathogen
  - Directly through cell wall
    - Leaf, stem, and root
  - Natural opening
    - stomata, lenticels
  - Wound
    - Mechanical, pruning, insect, physical injury

The diagram shows a cross-section of a plant cell wall. A 'germ tube' enters from the left, forming an 'appressorium' against the cell wall. From the appressorium, an 'infection peg' penetrates the cell wall, ending in a 'haustorium' inside the cell.

45

---

---

---

---

---

---

---

---

### Disease Development

46

- Infection:** penetrating and establishing a parasitic relationship with a host plant
- Latent infection:** an infection unaccompanied by visible symptoms

The diagram shows a cross-section of a plant's epidermal cells. A yellow spherical pathogen is shown on the surface. An arrow labeled 'Germination' points to the pathogen as it begins to enter the cells. A second arrow labeled 'Penetration' shows the pathogen fully entering the cells. Below the cells, a network of yellow hyphae is labeled 'Latent infection'.

---

---

---

---

---

---

---

---

46

### Disease Development

47

- Latent period:** the time between infection and the production of new inoculum and/or symptoms.
  - Host resistance
  - Environments
  - Types of fungal pathogens

The diagram shows the progression from latent infection to a visible sign. It includes labels for 'Germination', 'Penetration', 'Symptom' (a yellowish area on the plant surface), and 'Sign' (a cluster of yellow spores). The 'Latent infection' hyphae are shown below the surface.

---

---

---

---

---

---

---

---

47

### Disease Development

48

- Dispersal:** the spread of a fungal pathogen (inoculum) from diseased plants to healthy plants
  - Rain- or water-splash (short)
  - Wind or air movement (long)
  - Insects (depends on insect species and their mobility)
  - Human activity (short and long)

---

---

---

---

---

---

---

---

48

### Disease Development

49

- **Overwinter:** to **survive or persist** through the winter period
  - Soil
    - Resting structures (more than 5 years)
  - Plant debris
    - Saprophytic (1-2 years)
  - In/on living plants
    - Annual plants in protected structures
    - Perennial roots, bulbs, or tubers
    - Woody plants – roots, stems, buds, or leaves (evergreen)

CAES

---

---

---

---

---

---

---

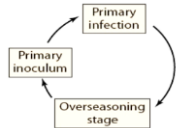

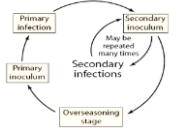

---

49

### Disease Development

50

- **Disease cycle:** a series of sequential events from **initial infection** to over-seasoning, until **another infection** occurs

- **Monocyclic:** only **one cycle** per season
- **Polycyclic:** **more than one** infection cycle per season

CAES

---

---

---

---

---

---

---

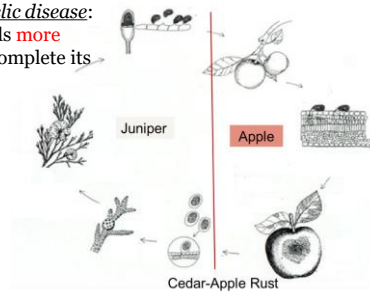

---

50

### Disease Development

51

**Multi-host life cyclic disease:** the pathogen needs **more than one host** to complete its life cycle

Cedar-Apple Rust

CAES

---

---

---

---

---

---

---

---

51

### Disease Management

52

#### Management Triangle

- Host resistance
- Reduced inoculum
- Favorable to host/ unfavorable to pathogen

CAES

---

---

---

---

---

---

---

---

52

### Integrated Pest Management

53

- a **sustainable**, science-based, decision-making process
- **combines** biological, cultural, physical and chemical tools to identify,
- **manage** and reduce risk from pests
- **minimizes** overall economic, health and environmental risks

CAES

---

---

---

---

---

---

---

---

53

### Disease Management - Host

54

- Right tree in the right place
  - Hardiness – USDA Zones 5-6
  - Resistant/tolerant cultivars/species
    - **Resistance**: the host's ability to **limit pathogen multiplication**
    - **tolerance**: the host's ability to **reduce the effect** of infection on its **fitness (yield and quality)** regardless of the level of pathogen multiplication
  - Rotation – genus or species

CAES

---

---

---

---

---

---

---

---

54

### Disease Management - Pathogen

55

- **Exclusion:** prevent the **introduction** of a new pathogen into a region, farm, or planting
  - Quarantines: continentals, nations, states, regions
    - White pine blister rust
    - Dutch elm disease
    - Sudden oak death
  - Disease-free plant materials:
    - Seed
    - Seedlings
    - Woody trees and shrubs

55

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

56

- **Eradication:** the **elimination or destruction** of the pathogen after it is introduced into an area
  - Removal and destruction of host plant
  - Chemical treatment of soil or seed to kill the pathogen
  - Crop rotation for soil-borne pathogens

WHITE PINE BLISTER RUST CONTROL IN CONNECTICUT

HOW TO PREVENT BLISTER RUST DAMAGE TO WHITE PINE

White pine, Connecticut's most valuable forest tree, is seriously threatened by the white pine blister rust. The greatest single factor at the present time in the control of the blister rust is the elimination of the European black currant. The growing and possession of this plant is prohibited by law in the State of Connecticut. Help control the blister rust by destroying all European black currants wherever found.

56

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

57

- **Sanitation:** the **destruction or removal** of infected and infested plants or plant parts; **decontamination** of tools, equipment, containers, work-space, hands, etc.
  - Destroy fallen leaves, fruits, and other plant materials
  - Prune diseased/dead branches
  - Sanitize tools with 10% household bleach or 70% alcohol

57

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

58

- Fungicide:** used to inhibit or kill the fungus causing the disease
  - Biofungicide:** derived from **plants and microorganisms**

Active Ingredient	Trade Name	Control
extract of giant knotweed	Regalia	Leaf spot, rust, downy mildew, powdery mildew, Pythium, Phytophthora, Rhizoctonia
<i>B. subtilis</i> QST 713	Cease	Leaf spot, Botrytis, downy mildew, rust, powdery mildew, Pythium, Phytophthora, Rhizoctonia
<i>Streptomyces lydicus</i>	Actinovate	Leaf spot, Botrytis, rust, downy mildew, powdery mildew, Pythium, Phytophthora, Thielaviopsis, Rhizoctonia
<i>Trichoderma harzianum</i> T-22 + <i>T. virens</i> G-41	Root Shield Plus	Pythium, Phytophthora, Thielaviopsis, Rhizoctonia
Harpin protein	Immune	Stimulate plant growth and disease resistance

---

---

---

---

---

---

---

---

---

---

58

### Disease Management - Pathogen

59

- Biorational fungicide:** relatively **non-toxic** to people with few environmental **side effects**

Active Ingredient	Trade Name	Control
copper	Phyton 27	Leaf spot, Botrytis, downy mildew, powdery mildew, Pythium, Thielaviopsis, Rhizoctonia
sulfur	Drexel Sulfur	Leaf spot, Botrytis, rust, powdery mildew
potassium bicarbonate	MiiStop	Leaf spot, Botrytis, rust, downy mildew, powdery mildew,
hydrogen dioxide	OxiDate	Leaf spot, Botrytis, rust, downy mildew, powdery mildew, Pythium, Thielaviopsis
neem oil	Triact 70	Leaf spot, Botrytis, rust, downy mildew, powdery mildew
horticultural oil	SuffOil-X	Rust, powdery mildew

---

---

---

---

---

---

---

---

---

---

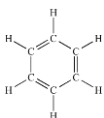

59

### Disease Management - Pathogen

60

- By chemical compound**
  - Inorganic fungicide:** derived from **sulfur or simple metal salts**; not contain the elements **carbon (C)**; generally **stable**, persistent, and insoluble in water.
 

$$\text{HO}-\text{Cu}-\text{OH}$$
  - Organic (synthetic) fungicide:** contain **carbon** atoms in their structure
 

---

---

---

---

---

---

---

---

---

---

60

### Disease Management - Pathogen

**61**

- **By mode of Action (MOA):** the specific **cellular process inhibited** by a particular fungicide.
- cell membranes
- enzymes or proteins
- energy production or respiration
- Activating plant defense mechanisms

#### Fungicide mode of action

61

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

**62**

- **Fungicide Resistance Action Committee (FRAC)**
- **FRAC MOA code:** **numbers** and **letters** used to distinguish the fungicide groups according to their **cross-resistance** behavior.

62

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

**63**

**Trade name**

**Formulation**

**Daconil® 720 Flowable Fungicide**

For control of turf and ornamental diseases

For control of diseases of apricot, cherry (sweet and tart), nectarine, peach, plum and prune trees

**Common name**

Active Ingredient:	
Chlorothalonil (tetrachloroisophthalonitrile)	54.0%
Other Ingredients:	46.0%
Total:	100.0%

Daconil 720 Flowable Fungicide is formulated as a suspension concentrate (SC) and contains 6.0 pounds chlorothalonil per gallon.

**GROUP M5 FUNGICIDE**

**FRAC MOA group**

63

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

64

- **By breadth of activity**
  - **Narrow-spectrum**
    - ✦ **single-site**: against only one point in a metabolic pathway or a single enzyme or protein
    - ✦ high chance of fungicide resistance
    - ✦ against only a few closely related fungi
  - **Broad-spectrum**
    - ✦ **multi-site**
    - ✦ low risk of fungicide resistance
    - ✦ against a large variety of fungi

64

---

---

---

---

---

---

---

---

---

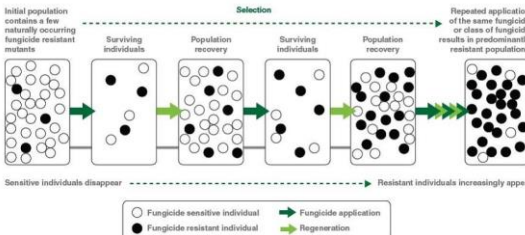

---

### Disease Management - Pathogen

65

#### QUALITATIVE RESISTANCE BUILD-UP

Initial population contains a few naturally occurring fungicide resistant mutants. Fungicide application kills sensitive individuals. Surviving individuals reproduce, leading to population recovery with a higher proportion of resistant individuals. Repeated application of the same fungicide or class of fungicide results in a predominantly resistant population.

Sensitive individuals disappear. Resistant individuals increasingly appear.

Fungicide sensitive individual

Fungicide resistant individual

→ Fungicide application

↻ Regeneration

Qualitative resistance: Pathogen population changing from a sensitive pathogen strain to an insensitive pathogen strain. (Modified from Stewart, 1988)

65

---

---

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

66

- **By mobility in plant**
  - **Contact (protectant)**: resides on **surface** of the leaf and provides protection
 

FRAC group	Active Ingredient	Trade Name
12	fludioxonil	Medallion, Maxim, Cannonball
	copper	Kocide, Champ
	sulfur	Microthiol Dispersa, Sulfur
M	mancozeb	Mancozeb
	captan	Captan
	chlorothalonil	Bravo, Daconil 2787
  - **Systemic**: moves **into** leaf and provides protection
    - ✦ Locally systemic
    - ✦ Xylem-mobile systemic
    - ✦ Phloem-mobile systemic

66

---

---

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

67

- Locally systemic fungicides:
  - move very **short distances** from the site of application

FRAC group	Active Ingredient	Trade Name
2	iprodione	Chipco 26GT
7	flutolanil	Contrast
11	kresoxim-methyl	Cygnus
	trifloxystrobin	Compass
17	fenhexamid	Decree
40	dimethomorph	Stature

67

---

---

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

68

- Xylem mobile fungicides:
  - move in xylem tissue **upward**

FRAC group	Active Ingredient	Trade Name
1	thiophanate-methyl	Clear's 3336
3	triflumizole	Procure, Terraguard
	myclobutanil	Eagle, Systhane
	tebuconazole	Folicur
	propiconazole	Banner Maxx
4	metalaxyl	Subdue Max
11	azoxystrobin	Heritage, Abound, Quadris, Stadium
18	streptomycin	Agri-Mycin, Agri-Step
19	polyoxin D	Endorse, Oso, PH-D

68

---

---

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

69

- Amphimobile/truly systemic fungicides:
  - moves in phloem out of the leaf where deposited **upwards** to other leaves and **downwards** to roots

FRAC group	Active Ingredient	Trade Name
P1	acibenzolar-S-methyl	Actigard, Messenger
33	fosetyl-aluminum	Aliette
	phosphorous acid	Alude, BioPhos

69

---

---

---

---

---

---

---

---

---

---

### Disease Management - Pathogen

70

- **By roles of protection**
  - Preventive
    - Contact action on the surface of the plant to which it have been applied
    - Prevent spore germination and infection
    - Repeated applications are needed
  - Curative
    - Able to penetrate plants and affect the pathogen after infection
    - Kill mycelium and fruiting bodies within the leaf

---

---

---

---

---

---

---

---

70

### Disease Management - Environment

71

- **Maintaining tree vigor & conditions unfavorable to pathogens**
  - *Plant requirements* : pH, drainage, light
  - *Mulching*: weed control, soil moist
  - *Fertilizing*: time, soil test, balanced nutrients
  - *Watering*: one inch water/week, deep soaking
  - *Avoid sprinkler/overhead irrigation*
  - *Air circulation*: lower humidity
  - *Avoid excessive water*: newly installed trees

---

---

---

---

---

---

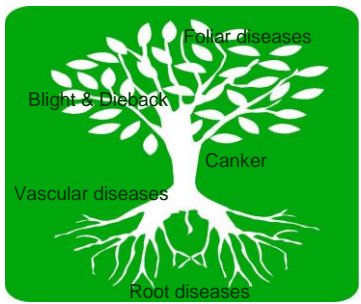

---

---

71

### Common Diseases
